**SUBMISSION OF PRIORITY DOCUMENT**

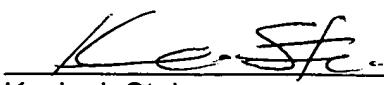

Assistant Commissioner for Patents  
Washington, D.C. 20231

Sir:

Pursuant to rule 55(b) of the Rules of Practice in Patent Cases, Applicant(s) is/are submitting herewith a certified copy of the United Kingdom Application No. 0223206.4 filed October 7, 2002, and United Kingdom Application No. 0223729.5 filed October 11, 2002, upon which the claim for priority under 35 U.S.C. § 119 was made in the United States.

It is respectfully requested that the priority document be made part of the file history.

Respectfully submitted,

  
Kevin J. Stein

INVESTOR IN PEOPLE

The Patent Office  
Concept House  
Cardiff Road  
Newport  
South Wales  
NP10 8QQ

I, the undersigned, being an officer duly authorised in accordance with Section 74(1) and (4) of the Deregulation & Contracting Out Act 1994, to sign and issue certificates on behalf of the Comptroller-General, hereby certify that annexed hereto is a true copy of the documents as originally filed in connection with the patent application identified therein.

In accordance with the Patents (Companies Re-registration) Rules 1982, if a company named in this certificate and any accompanying documents has re-registered under the Companies Act 1980 with the same name as that with which it was registered immediately before re-registration save for the substitution as, or inclusion as, the last part of the name of the words "public limited company" or their equivalents in Welsh, references to the name of the company in this certificate and any accompanying documents shall be treated as references to the name with which it is so re-registered.

In accordance with the rules, the words "public limited company" may be replaced by p.l.c., plc, P.L.C. or PLC.

Re-registration under the Companies Act does not constitute a new legal entity but merely subjects the company to certain additional company law rules.

#### Warning

After an application for a patent has been filed, the Comptroller of the Patent Office will consider whether publication or communication of the invention should be prohibited or restricted under Section 22 of the Patents Act 1977. You will be informed if it is necessary to prohibit or restrict your invention in this way. Furthermore, if you live in the United Kingdom, Section 23 of the Patents Act 1977 stops you from applying for a patent abroad without first getting written permission from the Patent Office unless an application has been filed at least 6 weeks beforehand in the United Kingdom for a patent for the same invention and either no direction prohibiting publication or communication has been given, or any such direction has been revoked.

#### Notes

- a) If you need help to fill in this form or you have any questions, please contact the Patent Office on 0645 500505.
- b) Write your answers in capital letters using black ink or you may type them.
- c) If there is not enough space for all the relevant details on any part of this form, please continue on a separate sheet of paper and write "see continuation sheet" in the relevant part(s). Any continuation sheet should be attached to this form.
- d) If you have answered 'Yes' Patents Form 7/77 will need to be filed.
- e) Once you have filled in the form you must remember to sign and date it.
- f) For details of the fee and ways to pay please contact the Patent Office.

FABRIC TREATMENT DEVICE

The present invention relates to a device for treating, fabrics inside a tumble dryer.

5

In the treatment of fabrics in a tumble dryer it is known to use conditioner dispensing articles, comprising means for attachment of the substrate to the tumble dryer wall. Other proposals, such as for instance disclosed in GB 1,399,728

10 involve the use of separate means for attaching the conditioning article to the tumble dryer wall.

EP-B-361593 concerns an alternative approach in which a fabric conditioning article comprises a combination of a 15 substrate and a fabric conditioning composition, the substrate being a porous material with a specified void volume and cell count. The article of EP-B-361593 is designed to adhere to the tumble dryer wall.

20 A problem with some devices of this kind is that it can be difficult to achieve a reliable attachment of the device to the tumble dryer interior.

It is an object of the present invention to provide an 25 improved device suitable for treatment fabrics in a tumble dryer, and in particular a device with improved attachment properties.

According to the present invention, there is provided 30 a device for treating fabrics in a tumble dryer during multiple tumble drying cycles, the device comprising a support member and a reservoir for storing fabric treatment

composition attachable to said support member, the support member including one or more suction cups for attachment of the support member to the tumble dryer interior, and preferably the door, wherein the suction cup/s have one or 5 more respective suction cup actuators.

With this arrangement, the reservoir does not restrict access to the suction cup. Force can therefore be applied directly to the suction cup actuator which allows for more 10 effective suction and consequently more effective attachment of the support member to the tumble dryer interior.

A further advantage is that attachment of the support member need not necessitate excessive pressure being exerted on the 15 reservoir which could then leak.

The suction cup and actuator may be moveable relative to e.g. resiliently mounted on the support member. An advantage of this is that force can be applied to the suction cup 20 actuator without restriction on such movement by the structure/rigidity of support member.

There may be one or more suction cups mounted substantially centrally on the support member. This gives the advantage of 25 a central point of attachment to the dryer interior, providing optimum stability of the device.

The suction cup may have a smoothly curved outer perimeter, e.g. circular or oval.

30 The suction cup may be of any suitable size appropriate to the size, weight of the dispenser.

As stated above, the invention allows more effective attachment of the suction cup, which therefore does not need to be excessively large.

5

The suction cup may occupy approximately from 30% to 90%, and preferably 40% to 60% of the total area of the support member. In one embodiment, the suction cup occupies 50% of the total area.

10

The device may be sized to allow manual installation using one hand. Accordingly the device may have an average diameter equivalent to an average hand span, e.g. 14 cm or less, and preferably 12 cm or less. In one embodiment the 15 device has an average diameter of approximately 11 cm.

The reservoir for storing fabric treatment composition may be attachable to said support member in any suitable manner. Preferably the reservoir is attachable so as to lock into 20 position. Accordingly the reservoir and support member may have corresponding inter-engagement members.

The inter-engagement members may comprise one or more pairs of projections or one or more pair projections and apertures 25 on corresponding respective portions of the reservoir and support member which are configured for snap-fit engagement.

By the term aperture, it is intended to mean any formation suitable for receipt of a projection, and accordingly this 30 term includes but is not limited to: slots, recesses, through-holes.

The inter-engagement members may include resilient portions to facilitate engagement. For example, the one or more projections may include respective resilient hinge portions to allow flexing of each projection during engagement with a 5 corresponding aperture.

Alternatively or additionally, the aperture may include resilient portions to facilitate engagement.

10 The one or more projections and/or apertures may include locking features to facilitate or improve snap-fit engagement. For example one or more projections may include one or more lugs which lock the projection/s into the respective aperture/s. The one or more lugs may be inclined 15 to facilitate smooth engagement.

The one or more projections may be biased toward a locking position with a respective aperture/projection, whereby relative resilience of the projection and or aperture and or 20 device itself allows movement of the projection for engagement/disengagement.

The device may include transfer means to expose fabric treatment composition from the reservoir to airflow 25 generated inside the tumble drier and/or to directly contact fabrics in the dryer, thereby transferring a portion of the fabric treatment composition into contact with fabrics in the tumble dryer during a tumble drying cycle.

30 The transfer means may comprise two or more flow control members arranged in series, wherein the flow control characteristic of the members decreases across the series.

The flow control characteristic preferably decreases in the direction of flow across the transfer means.

5 The flow control characteristic may decrease progressively across the series, i.e., it decreases with each flow control member, or there may be static regions of the transfer means, whereby the flow control characteristic remains unchanged across adjacent members, or even increases across 10 members within the series. However, preferably, there should be an overall decrease in the flow control characteristic across the series.

15 The transfer means may comprise at least an inner flow control member and an outer flow control member arranged in series, wherein the flow control characteristic of the inner flow control member is greater than that of the outer flow control member.

20 As used herein, the term "flow control characteristic " is intended to refer to any property which represents/brings about the impedance/control of the flow of fabric treatment composition passing through the member.

25 Decreasing the flow control characteristic across the series may involve selecting relative pore sizes of the respective members (e.g. an inner member having a higher flow control characteristic i.e. smaller pore size as compared an outer member having a lower characteristic (larger pore size.).

30 Other features may be selected additionally or alternatively to the pore size so as to control the flow, e.g. member thickness.

As used herein, the terms "transfer means" and "flow control member", should be construed as including any structure(s) acting to actively or passively allow the flow of fabric treatment composition thereacross whereby the composition from the reservoir can be exposed to the air in the dryer or to directly contact fabrics in the dryer.

With this arrangement, precise flow control and thereby precise dosing of fabric treatment composition may be effected by an inner flow control member(s) which is/are protected by an outer flow control member(s) which is/are less precise but may therefore be more robust so providing a barrier(s) or shield(s) for the inner member(s). Delicate but precise materials may be used for the inner member(s) but it/they is/are not subjected to mechanical damage by tumbling fabrics, zips, buttons etc during a tumble dry cycle because of the protection afforded by the outer member(s).

The advantage of the support member in this case is that this can be firmly attached to the interior of the dryer by directly applying force to the suction cup actuator, without any contact with and consequential pressure on the transfer means. The device reservoir can be attached afterwards, and can utilise an attachment mechanism which does not require excessive force (such as the snap fit arrangements referred to herein above), thereby protecting the transfer members.

The outer flow control member or members may be of greater rigidity than the inner flow control member(s). In this way, the outer members are not deflected to the extent that they

impinge on the inner membrane, as this could interfere with the precise flow control of the inner control member.

Preferably, the flow control member(s) are spaced apart to 5 define a gap therebetween, whilst being in fluid communication with each other and the reservoir. With this arrangement, any flexing of an outer member (e.g. in response to contact by fabrics, zips, buttons etc) can be isolated from the inner member, which is thereby protected. 10 Thus, any potential consequential interference in precise flow control exerted by an inner membrane is prevented.

Preferably the most delicate flow control member (e.g. the innermost) is spaced apart from the other flow control 15 members (which may not necessarily be spaced apart as they may not require protection).

The transfer means may be a dedicated component of the body or may form part of the device body and/or reservoir which 20 may be a optionally integral.

The inner flow control member(s) may, for example, comprise a membrane, or a layer of e.g. semi permeable material/s e.g. polyester, polypropylene or the like or a woven/non- 25 woven membrane which may be, but is not intended to be restricted to a thin skin.

The transfer means may be fixed in position around its perimeter and preferably has an effective area of 500-2500mm.

The reservoir may be removable from a housing or body portion locating the transfer means which is in fluid connection with the reservoir (when installed). Such fluid connection may be effected by a connecting channel or duct.

5

The fluid connection preferably includes an inlet port or channel for receiving a predetermined amount of the composition from the reservoir sufficient for a predetermined number of cycles at a given temperature, time 10 and load size and may further include a charging port or channel or recess situated directly behind the membrane for continuous feed or charging of the flow control members.

In further embodiments of the invention, the flow control 15 members may include a multiplicity of very small openings or pores. The inner member(s) may include a precise but delicate or mechanically weak structure as compared with the outer flow control member(s). Accordingly the inner member(s) may comprise a semi-permeable membrane through 20 which the fabric composition can be precisely dosed to the fabrics. Suitable semi-permeable materials may include Goretex™ and Accurel™. The outer flow control members may be formed from more rigid but less precise semi-permeable materials including open cell pumice, sintered materials 25 etc.

The transfer of fabric treatment composition to the fabrics in the tumble drier may be effected solely by airflow generated in the tumble drier. Depending upon the model of 30 the tumble drier and program setting temperatures of up to 100°C with wet clothes may be generated within the tumble drier, generally in the range 30°C to 80°C for most drying

cycles (the hot air generated by the heater in the tumble drier may be as high as 150°C, generally 110°C to 120°C).

5 In addition, the transfer may be constructed and arranged such that there may be direct contact between fabric in the tumble drier and the exposed fabric treatment composition in order to facilitate transfer of fabric treatment composition to the fabric.

10 Accordingly, the external profile of the flow control member(s) and/or that part/surface of the device in which the member(s) are located, may be shaped so that in use (i.e. attached to a generally upright tumble dryer wall or door) it/they are generally upright.

15 With this configuration, the Applicants have found that the member/part/surface can more easily contact the fabrics in the dryer directly contact fabrics in the dryer, thereby transferring a portion of the fabric treatment composition 20 into contact with fabrics in the tumble dryer during a tumble drying cycle.

The device may be configured to present a smooth external profile when attached to a door or wall. This feature has 25 the advantage that it prevents or at least can reduce the possibility of the device damaging the fabrics as they move through the dryer. It may not be important that the attachment part of the device is smooth, if this is not exposed when the device is fixed in place. In one embodiment 30 the external profile is generally hemispherical, and optionally including an upright (in use) portion as described above.

The reservoir may hold sufficient fabric composition for any number of drying cycles and for instance the reservoir may hold sufficient composition for a single cycle. With this 5 arrangement, different compositions could be used for different drying cycles allowing great flexibility for the user.

The reservoir of the device of the invention may 10 alternatively or additionally be capable of holding sufficient fabric treatment composition for a plurality of drying cycles of the tumble drier. In this case, the reservoir preferably holds sufficient composition for at least six, preferably at least ten drying cycles, more 15 preferably at least twenty cycles, of the tumble drier. The device may comprise means for dispensing a unit dose of fabric composition from the reservoir at or before the start of the drying cycle which is sufficient to provide the required amount of fabric treatment composition during the 20 drying cycle. The reservoir may be divided into a plurality of cavities or compartments each containing fabric composition, the contents of each cavity may be sequentially transferred to the transfer means.

25 The means for indicating to the user when the fabric treatment composition is used up preferably comprises visible indicia associated with the device. In one embodiment of the invention, the user is able simply to inspect the quantity of fabric treatment composition 30 remaining in the device by looking through the at least one opening of the reservoir to the composition therein. Alternatively, the fabric treatment composition may be

impregnated in a solid substrate which gives an appearance change, for example changes colour, when all the fabric treatment composition has been used up. In another embodiment of the invention, the reservoir may be formed 5 from a transparent or translucent material to allow visual inspection of the quantity of fabric treatment composition inside the reservoir.

The device of the invention may further comprise a flow 10 controller to allow the user to regulate the quantity of fabric treatment composition contacted by the warm air in the tumble dryer during a tumble drying cycle.

Preferably the device can be used to treat fabrics during 15 multiple tumble drying cycles. With this arrangement, the dispenser may be more convenient as the user only need replenish the fabric treatment composition after a number of cycles.

20 The device of the invention preferably comprises means for indicating to the user when the fabric treatment composition is used up, which has the advantage of enabling the user to determine when the fabric treatment composition or the device itself needs replacing. A further advantage of 25 attachment of the device to the tumble dryer door is that it makes it easier to replace or refill the device when the fabric treatment composition is used up than is the case with prior art devices attached to the tumble dryer drum.

30 The device according to the invention may comprise a reservoir which is designed to be replaced when the fabric treatment composition is used up. For example, the

reservoir may be provided in the form of a disposable plastic container e.g. bottle, carton or collapsible pouch which may have a peelable lid.

5 Alternatively, the reservoir may be designed to be recharged with a new fabric treatment composition when required. In this case the reservoir has an openable portion for charging and, if necessary, discharging the fabric treatment composition. For example, the reservoir may be provided in

10 the form of an openable compartment into which may be placed a block or semi-permeable sachet of fabric treatment composition. Suitable materials for the reservoir include polypropylene.

15 The fabric treatment composition may be in the form of a liquid, solid or gel. The composition preferably comprises at least a perfume component and optionally water and may also comprise one or more perfume solubilisers. In this way the composition can act as a freshening composition.

20

In addition, according to a further aspect of the invention there is provided a kit for the treatment of fabrics in a tumble drying cycle, comprising the combination of the device of the invention comprising support member and

25 reservoir together with a instructions for use of the device, including installation/refilling of said support member and reservoir.

In addition, according to the invention there is provided a

30 method of treating fabrics in a tumble dryer during multiple tumble drying cycles comprising attaching a support member and then reservoir of the device according to the invention

to the inside of a tumble dryer door and carrying out a tumble drying process with fabrics inside the tumble dryer.

Further provided in accordance with the invention is a  
5 tumble dryer with a support member (and optionally reservoir) of the device according to the invention attached therein.

Various non-limiting embodiments of the invention will now  
10 be more particularly described with reference to the following figures in which:

Figure 1 is a perspective view of a device according to one aspect of the invention, showing the support member and  
15 reservoir prior to attachment;

Figure 2 is a perspective view of the support member of Figure 1;

Figure 3 is perspective view of the reservoir of the device of Figure 1, showing components reservoir bottle and body in  
20 more detail; and

Figures 4a to 4b are various views of the reservoir bottle.

Similar reference numbers are used throughout the figures to identify common features.

25 Referring to the drawings, there is illustrated a device 1 (shown orientated upright and viewed in perspective) for treating fabrics in a tumble dryer (not shown) during multiple tumble drying cycles, the device comprising a support member 2 and a reservoir 6 for storing fabric treatment composition attachable to said support member 2, the support member 2 including a suction cup 8 for

attachment of the support member 2 to the tumble dryer interior, and preferably the door, wherein the suction cup 2 has a respective suction cup actuator 10.

5 The support member 2 is a generally circular element with a peripheral skirt 14.

The suction cup 8 and rigid actuator 10 are fixed together and resiliently mounted centrally on the support member by 10 means of a flexible bridge 12. The bridge 12 is supported by two inclined legs 16,18. The flexibility of the bridge 12 allows force to be applied to the suction cup actuator 10 without restriction on such movement by the skirt 14. Whilst 15 the legs are sufficiently stiff and the skirt 14 dimensioned to abut the surface of the interior of the dryer, so as to restrict movement of the support member 2 once attached.

The suction cup 8 has a radius of 3.6 cm and (when viewed in plan view) occupies 50% of the total area of the support 20 member 2 which has a radius of 5.4 cm (however the radius of the member 2 progressively increases to 5.8 cm at three points which will be described in more detail below).

The device 1 is sized to allow manual installation using one 25 hand.

The reservoir 6 comprises a rigid dome shaped body 20 housing a reservoir bottle 22 configured for snap-fit engagement in a recess (not shown) of body 20. The reservoir 30 recess constitutes a major part of the upper half of the body 20 (when orientated upright).

The reservoir 6 is attachable to the support member 2 so as to lock into position. Accordingly the reservoir 6 and support member have corresponding inter-engagement members 5 30,31,32,33,34,35.

The inter-engagement members comprise three pairs of projections 31,33,35 and apertures 30,32,34 on corresponding respective outer portions 31a,33a,35a of the reservoir body 10 20 and outer portions 30a,32a,36a of the skirt 14 of the support member 2 which are configured for snap-fit engagement.

15 The inter-engagement members 30,31,32,33,34,35 are resiliently mounted or include resilient portions to facilitate engagement. The projections 31,33,35 flex by means of limited radial resilience of skirt 14 upon which they are mounted.

20 The lowermost (when upright as shown in figures 1,2,3) of the apertures 32 has an inclined wall 40 to assist engagement of the corresponding projection 31. The remaining apertures 32,34 are simply rectangular through-holes. Thus, the device can be fitted firstly by inserting 25 projection 33 into aperture 32 to locate reservoir 6 relative to support member 2, and then simply pressing the remaining projections into their apertures.

30 The projections include locking lugs 41, 42, 43 lock the projections 31,33,35, into the respective apertures 30,32,34,. The lugs 41, 42, 43 are inclined radially inwards to facilitate smooth engagement.

Locking is improved by the projections 31,33,35 being biased radially outwards, toward a locking position with a respective projection 30,32,34, whereby relative resilience 5 of the mounting of the projections 31,33,35 allows movement of the projections 31,33,35 for engagement/disengagement.

As shown more clearly in figure 3, the reservoir body 20 includes a chamber or inlet port 208, having a capacity to 10 hold a predetermined volume of fluid freshener, which is, in this embodiment 1.5ml and is sufficient for one drying cycle of 1 hour at 60 degrees C. However, the inlet port may have a volume sufficient for any number of cycles. The port 208 is located beneath (when the device is held oriented as it 15 would be when attached to the dryer door) and in fluid communication with the reservoir recess 204 to allow liquid to enter the port 208 from the reservoir bottle 22 when it is in place in the recess 204.

20 As shown in figs 4a - 4g, the reservoir bottle 22 comprises a polypropylene bottle with body portion and neck portion 214. The body portion is defined by three main generally crescent shaped faces: a front face 222 and a rear face 224 and a shoulder face 226. The front and rear faces 222,224, 25 extend from opposed edges of the shoulder face 226 and depend therefrom to meet at a common curved edge 228. The radius of curvature of the rear face 224 is less than that of the front face 222.

30 The reservoir recess 204, has a curved back wall 230, base wall 232 and top wall or lip 234 which correspond in shape with the rear face 222 shoulder face 226 and edge 228

respectively so that the reservoir is retained in the recess by the walls 230, 232 and 234 and by the retaining overhanging edges of 202 and by the engagement of the neck portion 214 with the port 208. The neck is configured for 5 engagement with the inlet port 208, taking into account of any seals: The inlet port 208 may include an annular resilient seal 216 of a thermoplastic elastomer (TPE) to ensure leak proof engagement of the reservoir bottle 22 with the port 208.

10

The reservoir bottle 22 preferably has a pin-hole (not shown) in the edge region 228 or front face 222 or back surface 224 so that as fluid freshener leaves the bottle it can be replaced with air, gradually, so as not to interfere 15 with the gradual flow of the fluid to the membrane. This has the advantage of ensuring consistency in delivery of composition.

Insertion and removal is aided by limited flexibility of the 20 refill bottle 22 and reservoir body 20 such that snap-fit installation and removal can be effected easily.

The support member 2 is first attached to the tumble dryer interior, by applying direct force to the suction cup 25 actuator 10. The reservoir 6 can then be attached (with reservoir bottle in place or without) as and when fabric treatment composition needs to be dispensed. When no fabric treatment is required, the reservoir 6 can be removed and the support member 2 left in place.

30

The device shown further includes a transfer means and is the general dome shape is modified by inclining the portion

housing the transfer means outwardly, so that in use (i.e. attached to an upright tumble dryer door or wall) the transfer means is orientated upright.

- 5 The transfer means comprises two flow control members (not shown in detail but indicated at 300): an inner delicate but precise flow control member and an outer protective barrier or shield. The inner flow control member is a polypropylene membrane 210. In one embodiment this has with a thickness of 160 microns and a pore size of 0.2 microns. However other thickness/pore size values may be used, the appropriate pore size and thickness of the membrane varying depending on the fabric treatment composition viscosity, and the delivery rate required.
- 15 The outer membrane is a sinter material having a pore size of 35 micron, which is rigid as compared with the inner membrane and spaced apart therefrom. Flexing of the outer membrane is kept to a minimum due to its rigidity but if any flexing does occur (e.g. if more flexible material is used) 20 the space between inner and outer members means the inner membrane is not contacted by the outer membrane as it flexes. This protects the inner membrane.

This members are fixed around their perimeters preferably by ultrasonic welds and preferably, to enable a better seal (for the purpose of preventing leaking of the fabric treatment composition), by a substantially continuous weld, to a window frame 212.

30 Optionally, the inlet port 208, is integral with the window frame, again, to enable a leak proof system. The manufacture of the framed membrane involves melting upstanding ribs on the frame by ultrasonic welding so as to weld these to the

perimeter of the membrane. The framed membrane 210 is attached to the device body 202 (by the ultrasonic welding which is done with the port/frame/membrane in situ in the device body 202).

5 The area inside of the welded perimeter provides the effective flow control area that is to say the active part of the flow control members.

In the embodiments, the area is  $40 \times 27 \text{mm} = 1080 \text{mm}^2$ . Another 10 embodiments (not shown) may have has larger area of  $50 \times 27 \text{mm} = 1350 \text{mm}^2$ , or larger still, Such as  $80 \times 30 = 2400 \text{mm}^2$ . Preferably the effective part of the transfer means has an area in the range  $500-5000 \text{mm}^2$ .

Behind the members is a recess of corresponding shape which 15 has a slightly projecting perimeter region for attachment of the frame thereto, so that a gap is defined between the inner member and the recess wall. In this narrow gap approximately 2-3 mm, a small amount of freshener fluid can collect to 'charge' or 'feed' the members continuously 20 without causing leakages.

It is important to prevent leakage of the fabric treatment composition, as this can lead to staining of fabrics.

25 In use the reservoir bottle 22 is disposed with the neck pointing downwards, engaging the inlet port so that fluid from the reservoir bottle 22 flows, under gravity to the port and then to the members from where it evaporates/transfers in the dryer.

The fabric treatment composition may take any suitable form, for example it may be as described in any of the following embodiments (e.g. solid, liquid, gel at room temperature).

5 Exemplary fabric treatment compositions may be as follows:

A. A first fabric treatment composition, is defined as a heat activated fabric treatment composition comprising:

10 (a) from 3 to 75wt% of one or more fabric treatment active ingredients;

(b) from 10 to 50 wt% of water;

15 (c) from 5 to 40 wt% of an oil; and

(d) optionally from 2 to 20 wt% of a nonionic surfactant.

20 Samples of this composition are represented by a number. Comparative samples are represented by a letter.

All values are % by weight of the active ingredient unless stated otherwise.

25

The samples in table 1 were prepared as follows:

The quat, oil and optional solvent were weighed in a beaker and heated on a hot plate until molten (about 70°C). Hot

30 water (also about 70°C) was then slowly dosed into the molten mixture with stirring. To this mixture, perfume was

added and stirring continued until a 'clear' liquid was produced. The liquid was bottled and left to cool either in the bottle or on a rotary blender.

5 Table 1

Sample	1	2	3	A	B	C
Quat (1)*	50	50	50	80	50	50
Sirius M85 (2)	20	0	0	0	0	0
NP-35 (3)	0	20	0	0	0	0
Estol 1545 (4)	0	0	20	0	0	0
DPG (5)	5	5	5	10	0	5
PEG 200 (6)	0	0	0	0	25	0

Perfume	5	5	5	5	5	5
Water	20	20	20	5	20	20

(1) Stepantex VL85G(85%), tallow (IV about 35) based TEA quaternary ammonium material with 15% DPG solvent (ex Stepan)

10 (2) mineral oil, ex Fuchs

(3) mineral oil, ex Emca

(4) ester oil, ex Uniqema

(5) dipropylene glycol (ex Dow Chemicals). This was present in addition to any DPG present in the raw material of the quaternary 15 ammonium material.

(6) polyethylene glycol 200, ex Clariant

For materials in table marked "\*", the amount denotes the level of raw material present.

20

#### Staining Evaluation

Staining evaluation was then carried out on the fabrics identified in Table 2.

25

Table 2

Garment	Fabric type	Colour	Texture
Single jersey	100% acrylic	Multicolour	Knitted, thick
Sport trousers	100% nylon	buff	Woven with woven nylon lining, light
Green shirt	100% cotton	Green	Woven, light
Blue shirt	100% Polyester	Blue	Woven peach skin (brushed), heavy
Fleece	52% polyester 40% cotton 8% lastane		Towel looped knit, heavy
Jeans trousers	100% cotton	Blue	Denim
Cotton monitor	100% cotton	Black	Woven, light
Microfibre monitor	100% polyester	Pearly	Woven, light
Pongee monitor	100% polyester	Pink	Tuffata, lining type

5 A 1.5kg load was washed in a Miele Novotronic W820 washing machine using 80g of un-perfumed Persil fabric washing powder at a 40°C wash temperature. The fabrics were spin dried and then transferred to a Miele Novotronic T43 tumble dryer.

10

The dispensing device - as described on page 16 line 26 to page 20 line 12 and shown in Figures 1, 3 and 4 of patent application PCT/EP01/11785 having a membrane thickness of 160µm, a membrane pore size of 0.2µm and membrane area of 15 1080mm<sup>2</sup> - was charged with 30g of the sample and then attached to the internal side of the door of the tumble dryer and the 60 minutes "Cotton Extra Dry" drying cycle started. At the end of the cycle the fabrics were removed. Comparative evaluation with tumble dryer sheets was also 20 made (for each cycle a single tumble dryer sheet was used).

Staining was evaluated by a panel of trained laboratory personnel in a standard Viewing Cabinet (D65 light, simulating typical northern hemisphere outdoor light). The panel assessed the staining of the aqueous compositions with 5 a critical eye using different viewing angle and observing over a black background.

Unless otherwise indicated, each sample was assessed 3 times with the fabric being washed as described above between each 10 assessment.

Staining was ranked according to the number of stains and the size/visibility of the stains on a scale of from 0 to 5 where 0 represented no staining and 5 represented severe 15 staining.

The results are given in table 3 below.

Table 3

Sample	TDS (1)	TDS (2)	1	A
Microfibre	2.5	0	1	2
Pongee	-	-	1	3
Jeans	0	0	0	0.5

(1) Bounce - purchased in UK 2001

(2) Snuggle - purchased in US 2001

25 Delivery Evaluation

The following compositions were prepared according to the method described above.

Table 4

Sample	4	5	6	7	8	D	E
Quat (1)*	50	55	50	55	50	50	55
DC 245 (2)	25	20	0	0	0	0	0
NP-35 (3)	0	0	20	20	0	0	0
Estol 1545 (4)	0	0	0	0	20	0	0
DPG (5)	0	0	5	0	5	0	0
DPnB (6)	0	0	0	0	0	25	40
Perfume	5	5	5	5	5	5	5
Water	20	20	20	20	20	20	0

5 (1) Stepantex UL G80(80%), hardened tallow (IV < 1) based TEA quaternary ammonium material with 20% DPG solvent (ex Stepan)  
 (2) Volatile silicone oil, ex Dow Chemicals  
 (3) mineral oil, ex Emca  
 (4) ester oil, ex Uniqema  
 10 (5) ester oil, ex Uniqema  
 (5) dipropylene glycol (ex Dow Chemicals). This was present in addition to any DPG present in the raw material of the quaternary ammonium material.  
 (6) dipropyl glycol n-butyl ether

15 \*\* denotes the level of raw material present.

Delivery evaluation was carried out as follows:

20 Approximately 30g of the sample to be evaluated (table 4) was transferred to a dispensing device - described above. The device was then attached to the inside of the door of the Miele tumble dryer and the 60-minute "Cotton extra dry" heating cycle started..

25 For each sample, the amount of product delivered was measured at intervals during the heating cycle.

Delivery of between 1 and 2 grams of product during the 60 minute cycle was desirable. Below this amount, insufficient active ingredient would be delivered to the fabric.

5 Significantly greater amounts than this would cause staining problems.

The amount in grams of each sample delivered is given in table 5.

10

Table 5

Time/mins	0	10	20	30	40	50	60
Sample 5	0	0.04	0.11	0.28	0.5	0.76	1.06
Sample 6	0	0.2	0.5	0.7	0.9	1.2	1.4
Sample 7	0	0.05	0.14	0.38	0.68	0.92	1.04
Sample 8	0	0.5	0.67	1.11	1.3	1.59	1.8
Sample D	0	0.26	2.88	-	-	-	-
Sample E	0	0.89	2	-	-	-	-

For samples D and E, delivery was ceased after approximately

15 20 minutes due to the excess of product delivered.

Staining Evaluation

Staining evaluation of the samples of table 4 was then

20 carried out on the garments identified in table 2.

Evaluation was made according to the method described in the example above.

The results are given in table 6

25

Table 6

Garment	Sample 5	Sample 7	Sample 8	Sample D	Sample E
Single jersey	0	0.5	-	-	-
Sport trousers	0	0	-	-	-
Green shirt	0.5	0	-	-	-
Blue shirt	0.5	0	-	-	-

Jeans trousers	0	0.5	-	-	-
Cotton monitor	1	0	0.5	2.5	1.5
Microfibre monitor	0.5	0.5	1	3	2.5
Pongee monitor	0.5	0	1.5	4	3

" - " denotes not measured.

#### Perfume Evaluation

5

Perfume evaluation was also carried out using samples 4 to 8 and a standard commercially available tumble dryer sheet (Bounce, purchased in UK in 2001) over 10 wash and dry cycles.

10

A 1.5kg load containing equal weight mixtures of cotton, polycotton, polyester, nylon, acrylic, microfibre monitors and pongee polyester monitors was washed as described above. The washed articles were spin dried and transferred to a

15 Hotpoint Aquarius Tumble Dryer and then tumble dried for 60 minutes. This process was repeated 10 times, with the dispensing device remaining in position and without being recharged. After each cycle the articles were removed and assessed then washed and the cycle repeated until 10 cycles 20 completed. For the sample containing the tumble dryer sheet, a new sheet was introduced before each drying cycle.

For each of the samples 4 to 8, perfume strength on fabrics after each drying cycle was significantly stronger than

perfume strength on fabrics treated with the tumble dryer sheet.

Further Staining Evaluation

5

The following compositions were prepared by weighing the quat, oil, nonionic and optional solvent into a beaker and heating on a hot plate until molten (about 70°C). Hot water (also about 70°C) was then slowly dosed into the molten mixture with stirring. Perfume was added and stirring continued until a 'clear' liquid was produced. The liquid was left to cool either in a bottle or on a rotary blender.

15 (1) Bounce, purchased UK 2001.

An alternative composition B is defined as a heat activated fabric treatment composition comprising

20 (a) from 3 to 75wt% of one or more fabric treatment active ingredients;

(b) from 5 to 50 wt% of a nonionic surfactant; and

(c) from 10 to 50 wt% of water.

Examples of this kind of composition are as follows:

The samples in table B1 were prepared as follows:

The quat, nonionic and optional solvent were weighed in a beaker and heated on a hot plate until molten (about 70°C).

5 The molten mixture was then added with stirring to hot water (also about 70°C) to which optional components such as a polyelectrolyte or salt had already been added. To this mixture, perfume was added and stirring continued until a 'clear' liquid was produced. The liquid was bottled and 10 left to cool either in the bottle or on a rotary blender.

Table B1

Sample	A	1	2	3	4	5	6	7
Quat (1)*	80	10	20	0	0	0	0	0
Quat (2)*	0	0	0	40	40	40	30	10
Quaternised triethylene amine (3)	0	0	0	0	0	0	5	0
Polyelectrolyte (4)	0	0	0	0	0	0	0	16
Nonionic surfactant (5)	0	40	40	10	0	15	10	0
Nonionic surfactant (6)	0	0	0	0	15	0	0	33

"S" denotes that the composition was solid.

Delivery Evaluation

20

Delivery evaluation was carried out as follows:

25 Approximately 30g of the sample to be evaluated (table B1) was transferred to a dispensing device - as described on page 16 line 26 to page 20 line 12 and shown in Figures 1, 3 and 4 of patent application PCT/EP01/11785 having a membrane thickness of  $160\mu\text{m}$ , a membrane pore size of  $0.2\mu\text{m}$  and membrane area of  $1080\text{mm}^2$ . The device was then attached to the inside of the door of a Miele Novotronic T43 tumble 30 dryer and a 60 minute "Cotton Extra Dry" heating cycle started.

For each sample, the amount of product delivered was measured at intervals during the heating cycle. A comparison was also made with commercial tumble dryer sheets. The amount in grams of each sample delivered is given in table B3.

Table B3

Time/mins	0	10	20	30	40	50	60

10

(1) commercial tumble dryer sheets purchased in US December 2001.

#### Staining Evaluation

15

Staining evaluation was then carried out on the fabrics identified in Table B4.

Table B4

20

Garment	Fabric type	Colour	Texture
Single jersey	100% acrylic	Multicolour	Knitted, thick
Sport trousers	100% nylon	Buff	Woven with woven nylon lining, light
Green shirt	100% cotton	Green	Woven, light
Blue shirt	100% Polyester	Blue	Woven peach skin (brushed), heavy
Fleece	52% polyester 40% cotton 8% lastane		Towel looped knit, heavy

Jeans trousers	100% cotton	Blue	Denim
Cotton monitor	100% cotton	Black	Woven, light
Microfibre monitor	100% polyester	Pearly	Woven, light
Pongee monitor	100% polyester	Pink	Tuffata, lining type

A 1.5kg load was washed in a Miele Novotronic W820 washing machine using 80g of un-perfumed Persil fabric washing powder at a 40°C wash temperature. The fabrics were spin dried and then transferred to a Miele Novotronic T43 tumble dryer.

The dispensing device - as described above - was charged with 30g of the sample and then attached to the internal side of the door of the tumble dryer and the 60 minute "Cotton Extra Dry" drying cycle started. At the end of the cycle the fabrics were removed.

Staining was evaluated by a panel of trained laboratory personnel in a standard Viewing Cabinet (D65 light, simulating typical northern hemisphere outdoor light). The panel assessed the staining of the aqueous compositions with a critical eye using different viewing angle and observing over a black background.

Unless otherwise indicated, each sample was assessed 3 times with the fabric being washed as described above between each assessment.

Staining was ranked according to the number of stains and the size/visibility of the stains on a scale of from 0 to 5

where 0 represented no staining and 5 represented severe staining.

The results are given in table B5 below.

5

Table B5

Sample	A	1	2	3*	6	7*
Black monitor	2.0-2.0	1.0-1.5	0.5-1.5	1.0-1.5	0.5-1.0	0
Blue shirt	2.0-2.0	0.0-1.5	0.0-1.5	2.0-2.5	0.5-1.5	0
Pongee	3.0-3.0	0.0-1.0	0.0-0.5	1.0-1.5	0.5-1.0	0
Green shirt	1.0-2.0	1.0-1.5	0.0-0.5	1.5-2.0	0-1.5	0
Microfibre (monitor)	1.5-2.0	0.5-1.0	0.0-1.0	2	0.0-2.0	0
Sport trousers	0.0-1.0	0	0	0	0	0
Fleece	0.0-0.50	0	0	0	0	0
Jeans	0.0-0.50	0	0	0	0	0
Jersey	0.0-0.50	0	0	0	0	0

\*single test only

10

#### Further Staining Evaluation

Staining evaluation was also carried out using the samples (table B1) and a standard commercially available tumble

15 dryer sheet (Bounce, purchased in UK in 2001) over 10 wash and dry cycles.

A 1.5kg load containing equal weight mixtures of cotton, polycotton, polyester, nylon, acrylic, microfibre monitors and pongee polyester monitors was washed as described above. The washed articles were spin dried and transferred to a Hotpoint Aquarius Tumble Dryer and then tumble dried on

medium setting for 60 minutes. This process was repeated 10 times, with the dispensing device remaining in position and without being recharged. After each cycle the articles were removed and assessed then washed and the cycle repeated 5 until 10 cycles completed. For the sample containing the tumble dryer sheet, a new sheet was introduced before each drying cycle.

10 Staining was evaluated using the method described above. The average results over the ten cycle are given in table B5.

Table B5

Sample	Bounce	2
Delivery/g	0.42	1.15
Static	2.11	0.11
Cling	2.36	0.26
Pongee	1.13	0.06
Microfibre	1.83	0.39
Average Stain	1.48	0.23

15 The results demonstrate that the amount of the sample of the invention (and hence the amount of active ingredient) deposited on the fabrics was significantly greater than the amount deposited from the tumble dryer sheet. In spite of this, the staining evaluation results show a significantly 20 lower level of staining on fabrics treated with sample 2 than on fabrics treated with the commercially available tumble dryer sheet.

CLAIMS

1. A device for treating fabrics in a tumble dryer during multiple tumble drying cycles, the device comprising a support member and a reservoir for storing fabric treatment composition attachable to said support member, the support member including one or more suction cups for attachment of the support member to the tumble dryer interior, and preferably the door, wherein the suction cup/s have one or more respective suction cup actuators.
2. A device according to claim 1 wherein the said one or more suction cups and actuators are moveable relative to e.g. resiliently mounted on the support member.
3. A device according to any preceding claim where said one or more suction cups are mounted substantially centrally on the support member.
4. A device according to any preceding claim wherein the suction cup has a smoothly curved outer perimeter, e.g. it is circular or oval.
5. A device according to any preceding claim wherein the suction cup the suction cup occupies approximately from 30% to 90%, and preferably 40% to 60% of the total area of the support member.
6. A device according to claim 5 wherein the suction cup occupies 50% of the total area.

7. A device according to any preceding claim, wherein the device has an average diameter equivalent to an average hand span, e.g. 14 cm or less, and preferably 12 cm or less.

5

8. A device according to claim 7 wherein the device has an average diameter of approximately 11 cm.

9. A device according to any preceding claim wherein the 10 reservoir and support member have corresponding inter-engagement members so the reservoir for storing fabric treatment composition is lockable to said support member.

10. A device according to claim 9 wherein the inter-engagement members comprise one or more pairs of projections or one or more pair projections and apertures on corresponding respective portions of the reservoir and support member which are configured for snap-fit engagement.

20

11. A device according to claim 9 or 10 wherein the inter-engagement members include resilient portions to facilitate engagement.

25 12. A device according to claim 11, wherein, the one or more projections include respective resilient hinge portions to allow flexing of each projection during engagement with a corresponding aperture.

30 13. A device according to claim 11 or 12 wherein the or each aperture includes resilient portions to facilitate engagement.

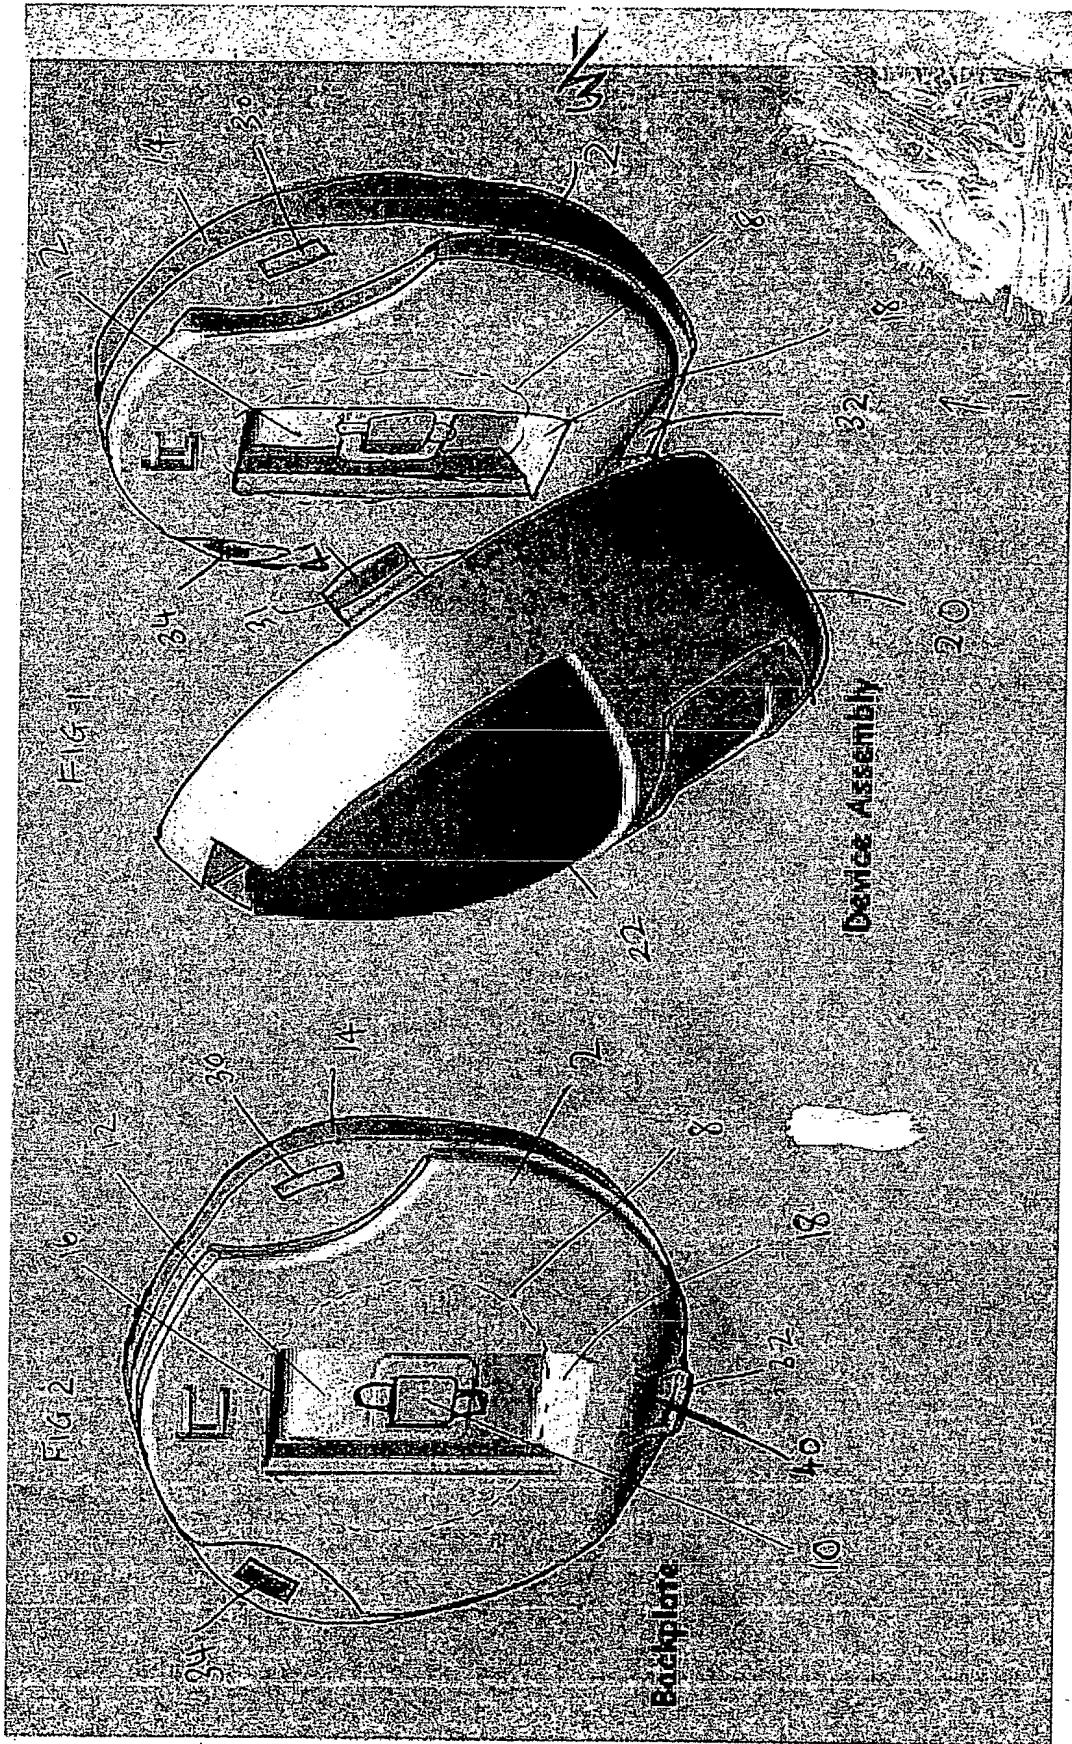

14. A device according to any preceding claim wherein said or  
more projections and/or apertures include locking  
features to facilitate or improve snap-fit engagement  
5 comprising one or more lugs on projections which lock the  
projection/s into the respective aperture/s.

15. A device according to claim 14 wherein said one or more  
lugs are inclined or include inclined portions to  
10 facilitate smooth engagement.

16. A device according to any preceding claim wherein the  
one or more projections are biased toward a locking  
position with a respective aperture/projection, whereby  
15 relative resilience of the projection and or aperture and  
or device itself allows movement of the projection for  
engagement/disengagement.

Abstract

A device 1 for treating fabrics in a tumble dryer during multiple tumble drying cycles, the device comprising a  
5 support member 2 and a reservoir 6 for storing fabric treatment composition attachable to said support member 2, the support member including one or more suction cups for attachment of the support member 2 to the tumble dryer interior, and preferably the door, wherein the suction cup/s  
10 8 have one or more respective suction cup actuators 10.
